Note 1: The suffix -H indicates the part with Heat sink, -T (H) indicates a kind of chassis packaging with terminals(with heat sink), -TS (H) indicates a kind of packaging of DIN Rail (with heat sink).

Note 2: The maximum capacitive load is the capacitance allowed to be used when the power supply operate at full load. The converter may not start up if the capacitor exceeds this value.

Note 3: The chip could operate at jitter frequency situation at no load or light load to decrease no-load power consumption and improve the efficiency.

Note 4: The output cannot be no-load, $\geq 5\%$ load or a high-frequency resistance E-cap($\geq 470\mu\text{F}$) load is recommended, to avoid the output ripple increasing.

Trim and Calculation of Trim resistor values

Calculating Trim resistor values:

$$\text{up: } R_T = \frac{aR_2}{R_2 - a} - R_3 \quad a = \frac{V_{ref}}{V_o' - V_{ref}} \cdot R_1$$

$$\text{down: } R_T = \frac{aR_1}{R_1 - a} - R_3 \quad a = \frac{V_o' - V_{ref}}{V_{ref}} \cdot R_2$$

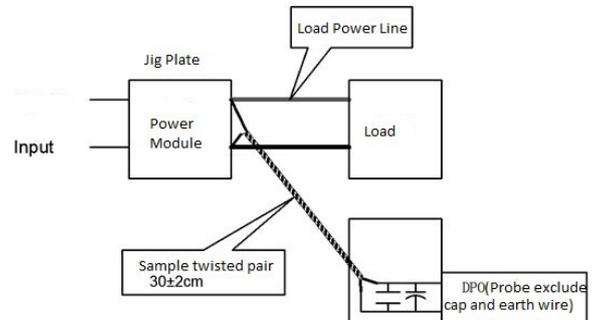

\$R_T\$ = Trim Resistor value;
 \$a\$ = self-defined parameter, no actual meaning;
 \$V_o'\$ is the actual voltage to increase or decrease;

Note: Trim up & down circuits, the components in the dotted area are inside of the converter.

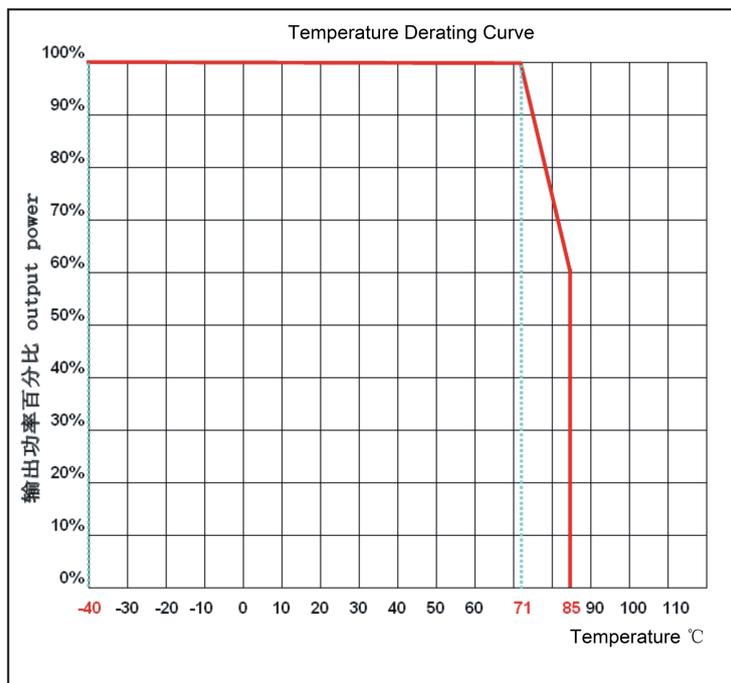

Ripple & Noise Test Instruction (Twisted Pair Method, 20MHz Bandwidth)

Test method:

- 1) Ripple noise test need 12# twisted pair cables, an oscilloscope which bandwidth should be set to 20MHz, 0.1uF polypropylene capacitor and 47uF high-frequency low-resistance electrolytic capacitor are connected in parallel with the probes (100M bandwidth). The oscilloscope should be set on the Sample Mode.
- 2) The output ripple noise test diagram is shown on the right. The converter output connects to the electronic load by the jig with cables which size should be defined according to the output current value. The twisted pair (length 30cm±2 cm) should be connected in parallel with the load, the location is as close as possible to the output pins or terminals. The test can be started after input power on.
