Product Performance Curve

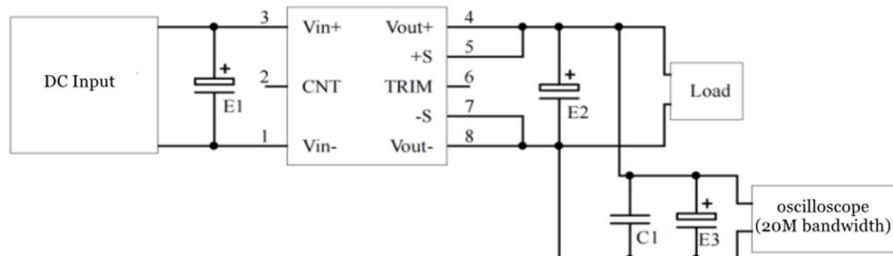

Note:

- Both the output power and efficiency in both curves are tested with typical values.
- The temperature derating curve is tested at Aipu laboratory test conditions. It is recommended to keep the temperature of the case not more than 100 °C while the converter operates at the rated load range for customer application.

2. Recommended Application Circuit

If this circuit recommended is not adopted, please connect an electrolytic capacitor $\geq 100 \mu\text{F}$ in parallel at the input to suppress the possible surge voltage at the input.

L3	$\geq 0.2\text{mH}$, temperature rise less than 25°C@4.2A

3. Remote Control (CNT) Application

4. Application for Sense

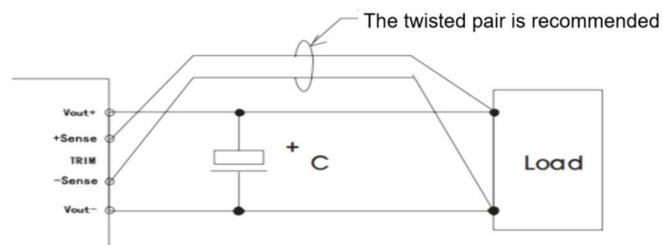

1) With NO distal end compensation

Notes:

1. V_{out+} & $Sense+$, V_{out-} & $Sense-$ should be shorted when distal compensation is not needed
2. The lead wire between V_{out+} and $Sense+$, V_{out-} and $Sense-$ should be as short as possible, and close to the pins, or else the output may be unstable.

2) With distal end compensation

Notes:

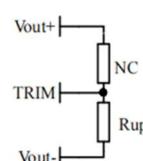

1. The output voltage may be unstable if the compensation cables are too long.
2. Twisted pair or shielded cables are recommended, the cable length should be as short as possible.
3. Wide copper path on PCB or thick lead wires between the power supply and the load should be used to achieve the line voltage drop $<0.3V$. The target is to keep output voltage within the specified range.
4. The leads wire resistance may create the output voltage oscillation or larger ripples. Please verify it before to use.

5. TRIM & TRIM resistance calculation

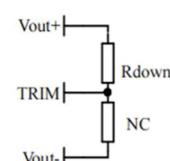

The calculation of ΔU and R_{up} & R_{down} :

$$R_{up}=107.5/\Delta U-5.1 \text{ (K}\Omega\text{)}$$

$$R_{down}=43*(33.5-\Delta U)/\Delta U - 5.1 \text{ (K}\Omega\text{)}$$

Voltage-up: Add R_{up} between Trim and V_{out-}

Voltage-down: Add R_{down} between Trim and V_{out+}
