Product Performance Curves

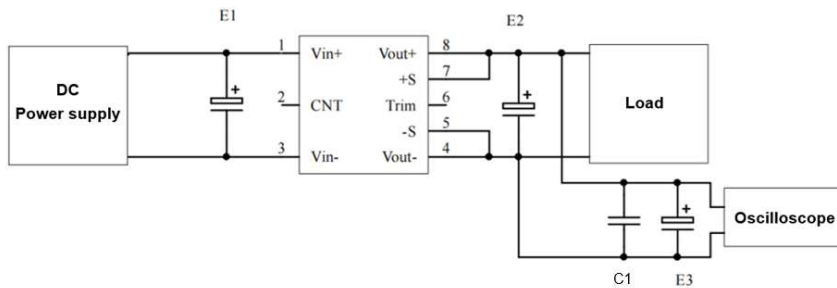

Note:

1. The output power and the efficiency in the curves are tested with typical values.
2. The data in temperature derating curve is tested at Aipu laboratory test conditions. It is recommended to keep the temperature of the Metal base not more than 100 °C while the converter operates at the rated load for the customer application.

2. Typical application circuit

If this circuit recommended below is not adopted, please connect an electrolytic capacitor $\geq 100 \mu\text{F}$ in parallel at the input to suppress the possible surge voltage.

RV1	14D 63V Varistor
C1, C2	105/63V Polyester Film Capacitor
CY1, CY2, CY3, CY4, CY5, CY6	472/250Vac Y2 capacitor

3. Remote control (CNT) application

4. Application for Sense

1) With NO distal end compensation

- Notes:
1. Vout+ & Sense+, Vout- & Sense- should be shorted when distal compensation is not needed
 2. The lead wire between Vout+ and Sense+, Vout- and Sense- should be as short as possible, and close to the pins, or else the output may be unstable.

2) With distal end compensation

- Notes:
1. The output voltage may be unstable if the compensation cables are too long.
 2. The Twisted pair or shielded cables are recommended, the cable length should be as short as possible.
 3. Wide copper path on PCB or thick lead wires between the power supply and the load should be used to achieve the line voltage drop <0.3V. The target is to keep output voltage within the specified range.
 4. The leads wire resistance may create the output voltage oscillation or larger ripples. Please verify it before to use.

5. TRIM & TRIM resistance calculation

The calculation of ΔU and Rup & Rdown:

$$R_{up} = 37.5 / \Delta U - 5.1 (K\Omega)$$

$$R_{down} = 15 * (15 - 2.5 - \Delta U) / \Delta U - 5.1 (K\Omega)$$

Voltage-up: Add Rup between Trim and Vout-

Voltage-down: Add Rdown between Trim and Vout+

6. This converter is not available for connection in parallel to increase the output power. Please contact Aipu technician for this kind of requirement.
