Recommended circuits for application

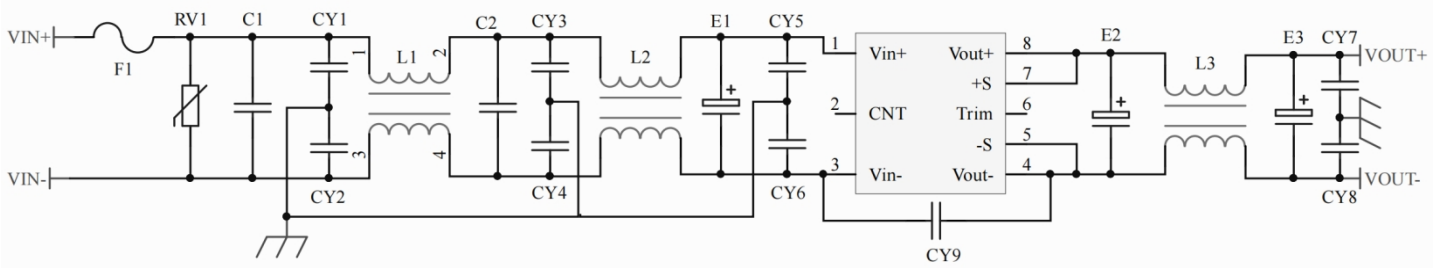

1. Ripple & Noise

All this series of products will be tested according to this circuit diagram below before shipping.

2. Recommended circuit for application

If this circuit diagram recommended below is not adopted, an electrolytic capacitor $\geq 100 \mu\text{F}$ should be used at the input to suppress the possible surge voltage.

3. Recommended circuit diagrams for the ON/OFF control (CNT)

4. Application for Sense

1) With NO distal end compensation

- Note:
1. Vout+ & Sense+, Vout- & Sense- should be shorted when distal end compensation is not needed
 2. The lead wire between Vout+ and Sense+, Vout- and Sense- should be as short as possible, and close to the pins, or else the output may be unstable.
- 2) With distal end compensation

- Notes:
1. The output voltage may be unstable if the compensation cables are too long.
 2. The twisted pair or shielded cables are recommended, the cable length should be as short as possible.
 3. Wide copper path on PCB or thick lead wires between the power supply and the load should be used to achieve the line voltage drop <0.3V. The target is to keep output voltage within the specified range.
 4. The leads wire resistance may create the output voltage oscillation or larger ripples. Please verify it before to use.

5. Output voltage TRIM and calculation of TRIM resistance

The calculation of ΔU and R_{up} & R_{down} :

$$R_{up} = 31 / \Delta U - 5.1 \text{ (K}\Omega\text{)}$$

$$R_{down} = 12.4 * (9.5 - \Delta U) / \Delta U - 5.1 \text{ (K}\Omega\text{)}$$

Voltage-up: Add R_{up} between Trim and Vout-

Voltage-down: Add R_{down} between Trim and Vout+

6. This product is not available to be connected in parallel to increase the output power. Please contact Aipu technician for this kind of requirement.
