**Product Performance Curves**

- Notes:
- Both temperature derating and efficiency curves are based on typical values.
  - Derating curves are measured under our laboratory conditions. If the actual application environment differs, ensure the case temperature does not exceed 100° C. The module can be used at any load within its rated range provided this temperature limit is maintained.

**3. Remote Sense: Usage & Precautions**

**1) Without Remote Sense**

Precautions:

1. If the remote sense function is not used, ensure +S is shorted to +Vout and -S is shorted to -Vout.
2. The connections between +Vout / +S and -Vout / -S must be as short as possible and placed close to the pins; otherwise, the module's stability may be compromised.

**2) With Remote Sense**

Precautions:

1. With remote sense, excessively long sense leads may cause output voltage instability.
2. With remote sense, use shielded twisted pair wires and keep them as short as possible.
3. Use wide PCB traces or heavy-gauge wires between the module and the load. Ensure the total voltage drop is below 0.3V to maintain the output voltage within specified limits.
4. Lead impedance may cause output voltage oscillation or increased ripple; please verify performance prior to use.

**4. TRIM & TRIM resistance calculation**

Output Voltage Trim Range vs. Resistor Value:

Voltage-up: Add Rup between Trim and Vout-

$$R_{up} = 31 / (\Delta U - 5.1) \text{ (K}\Omega\text{)}$$

Voltage-down: Add Rdown between Trim and Vout+

$$R_{down} = 12.4 * (9.5 - \Delta U) / (\Delta U - 5.1) \text{ (K}\Omega\text{)}$$
